Appendix I – Rubrics and checklist for Part 1 Milestone 3 review: Project Status and UI Review.

1. ***UI and functionality feedback (P1 functions only)***
P1 features demonstrated: P1-01 User registration and profile management; P1-02 Exercise library and demonstrations; P1-04 Workout program selection; P1-05 Workout execution and logging.

2. Instructor's comments on UI/functionality for the demo

1. Assessment implementation
2. At least 3 complete demos
3. History analytics set up

3. Your plan for the comments

A. **Fitness Assessment:** Ian will coordinate with the back-end lead Geo to complete the assessment workflow and database integration. The assessment will capture a user's initial exercise performance and provide baseline values for calculating prescribed training volume. Half of this implementation is already done.

B. **Exercise Demonstrations:** Front-End lead Peter will coordinate with Back-End Lead Geo to integrate at least three complete exercise demonstrations, ensuring that media playback and presentation are compatible with the application's existing interface. Ian and Alisha will collaborate on producing the necessary video demonstrations to provide to Peter and Geo.

C. **Workout History and Analytics:** The team as a whole will expand the workout history feature to visualize prescribed versus actual training performance. Recorded workout data will be used to display progress trends and support future adjustments to training prescriptions.

- Ian is already working on the assessment implementation. As of the demo, the implementation was halfway complete. He will coordinate with our back-end lead Geo to complete the database for full logic.
- Peter will be working with Back-End Lead Geo to ensure smooth transitions and that demo videos align with the format of our web page.
- Front end and back end will continue setting up workout history if the user wants to check on progress during or after the initial assessment.
- We need to upload the Insta360 scan into Niantic's system to convert it to a usable .glb file for further testing on the web page.

Section: 06 Team: 1 Date: November 4th, 2026
Number of students present: 6

- Additional and future exercises need to be collected at a later date to be uploaded to KinemIQ's application for conversion. We will add videos into individual exercise pages when available.
- Assessment and workout history features will be implemented separately before merging the two for testing.
- Front-end development will continue integrating workout recording functionality with the back end to ensure completed exercises, sets and repetitions are properly saved to the database.

4. List of P1 features committed for delivery

P1-01: User registration and profile management. Users can create accounts, log in, log out securely, and maintain a personal fitness profile containing their goals, training schedule and available equipment.

P1-02: Exercise library and demonstrations. Users can browse exercises, view exercise instructions and equipment requirements, and access visual demonstrations. At least three complete exercise demonstrations will be integrated into the application by Milestone 4.

P1-03: Fitness assessment and training prescription. Users complete an initial fitness assessment for their selected program. The results establish baseline performance measurements used to calculate personalized exercise prescriptions and provide a reference for measured progress.

P1-04: Workout program selection and management. Users can browse and select structured workout programs based on their fitness goals and experience. Workout sessions will display estimated duration, exercises, prescribed sets and repetitions, and core versus accessory exercise classifications.

P1-05: Workout execution and logging. Users can start workout sessions, record exercise performance, and save completed workouts. Recorded information includes relevant performance measurements such as repetitions, weight and duration. For clarification, video recordings of user sets are not included.

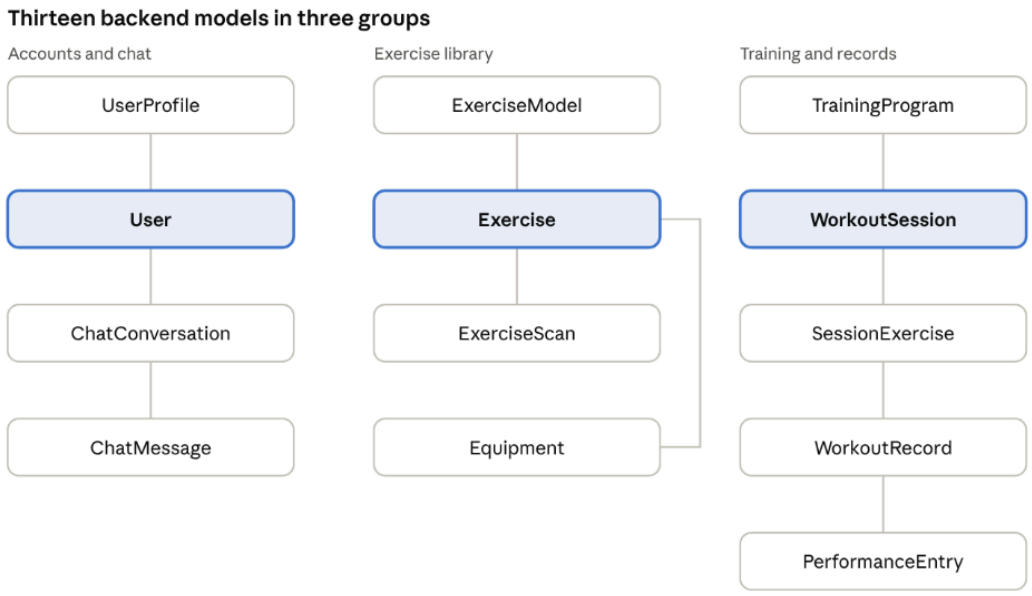

P1-06: Workout history, progress analytics and adaptation. Users can review their workout history and visualize progress through performance charts. The application compares prescribed and actual training performance to support adjustments for future workout prescriptions.

P1-07: AI fitness assistant (chatbot). Users can interact with an AI-powered fitness assistant to ask exercise and training questions. The assistant provides responses using available conversation history and user profile information, for the purpose of advising but not coaching or making any prescriptions.

Risks

1. Fitness Assessment and Database Integration

Current Status: The initial fitness assessment was approximately 50% complete during the Milestone 3 demonstration.

Risk: The remaining assessment workflow and database integration have not been completed, limiting the application's ability to generate personalized workout prescriptions.

Resolution Plan: Ian will continue developing the assessment functionality with Geo, our back-end lead. They will focus on completing data storage, assessment calculations and integration with workout prescriptions.

2. Exercise Demonstration Implementation

Current Status: The team needs to complete at least three working exercise demonstrations.

Risk: Exercise videos still require integration and testing to ensure they display and function correctly within the website.

Resolution Plan: Prash and Alisha will provide exercise demonstration videos, while Peter and Geo will coordinate their integration into the application and verify playback functionality.

3. Workout History and Analytics

Current Status: Workout history and analytics are still under development.

Risk: Incomplete workout data storage and visualization limit users' ability to track their

progress and compare prescribed training volume with actual performance.

Resolution Plan: The front-end and back-end developers will continue connecting workout records to the database and implementing charts to display progress over time.
