Underlying Technology

Below is a list of the technologies used in Team 01's software stack:

Cloud/Hosting Platform	: Vercel
Database	: Supabase
Front-end Framework	: React/Next.js
Back-end Language	: Python
Back-end Framework	: FastAPI
Additional Technologies	: Notion, Claude, ChatGpt, Gemini, Canva
IDE/Code Editor	: Visual Studio Code
Version Control	: Git/GitHub

How to access cloud/hosting platform

Item	Credentials
Website URL	https://frontend-team01-0e5b.vercel.app/
Cloud VM instance	N/A
Database URL	db.fapktwxbhoochkvbzmjgl.supabase.co

Study Plan

Team 01's study plan for each technology						
	Vercel	JS/ Next.js	React	Python/ FastAPI	Supabase/ Postgres	Git
Alisha	1	2	2	Python-3- 4 FastAPI - 3	2	3
Dong	1	5	5	Python - 3 FastAPI-2	2	3
Geo	1	3	3	Python - 4 FastAPI-3	3	3
Ian	1	2	2	1	2	3
Prashrit	1	2	2	2	2	3
Zaw	3	3	3	3	3	3

based on the scale of 5

Based on team member's familiarity, we set up the following study plan.

Two patterns jump out: everyone is weak on Vercel (mostly 1/5), and Ian/Prashrit are behind across the board and will need more pairing time than the rest of the team.

Study Assignments by Technology (Currently we have plan for the next 4-6 weeks)

1. Next.js / React (Frontend)

- **Lead: Dong (Frontend Lead, React 5/5)**
- **Also studying: Alisha, Ian, Prashrit (all around 2/5) – Geo (Backend Lead) is pitching in too, per the original plan**
- **4-week goal: Login page, plus 5 pages – workout plans, user category, saved plans, meal plans, AI chatbot page**

	Week 1	Week 2	Week 3	Week 4
Focus	Next.js/React basics (components, hooks, routing) – Dong walks the team through it	Build Login page + navigation shell	Build workout plans, user category, saved plans pages	Build meal plans + AI chatbot page, polish styling

2. Python / FastAPI (Backend)

- **Lead: Geo (Backend Lead, Python 4/5, FastAPI 3/5)**
- **Also studying: Alisha (already solid at 3/3), Dong, Ian, Prashrit (need the most ramp-up here)**
- **Note: Prashrit is our AI Master – as he ramps up on FastAPI, have him focus specifically on the chatbot and ML-prediction endpoints so his role and his study time line up**
- **4-week goal: Core API running – auth, plan CRUD endpoints, chatbot endpoint stub**

	Week 1	Week 2	Week 3	Week 4
Focus	FastAPI basics – routes, request/response models, auto docs (Swagger)	Build auth endpoints, connect to Supabase/Postgres	Build CRUD endpoints for workout/diet plans	Build chatbot endpoint stub, connect to frontend

3. Supabase / PostgreSQL (Database)

- **Lead: Geo**
- **Also studying: Zaw, Dong**
- 4-week goal: Finalized schema, Supabase project wired up to the backend

	Week 1	Week 2	Week 3	Week 4
Focus	Learn Supabase basics – auth, tables, row-level security	Design schema (users, plans, logs)	Connect FastAPI backend to Supabase via ORM	Test queries end-to-end, handle edge cases

4. Vercel (Deployment)

- **This is our biggest team-wide gap – everyone is at 1/5 except Zaw (3/5)**
- **Lead: Zaw (GitHub Master) runs a workshop for the whole team**
- 4-week goal: Everyone can deploy and read build logs without help

	Week 1	Week 2	Week 3	Week 4
Focus	Zaw-led workshop: connecting the GitHub repo, env variables, preview deployments	Everyone deploys their own branch/preview at least once	Practice debugging a failed build together as a team	Deployment becomes routine – no more hand holding

5. Git (Team Workflow)

- **Owner: Zaw (GitHub Master) – sets up branch protection, PR templates, and repo structure**
- **Everyone's already decent here (3/5 across the board), so this is a light touch, not a deep study item**
- 4-week goal: One agreed-on branching + PR workflow that actually gets followed

	Week 1	Week 2	Week 3	Week 4
--	--------	--------	--------	--------

Focus	Agree on branch naming, PR template, commit style	Practice it on every PR	Keep practicing it on every PR	Team retro – fix whatever's been annoying about the workflow
Future Plans 1. RAG 2. LLM API Use 3. Voice Agent (still debating) 4. Data Analytics 5. Niantic Spatial API (Researching) A Few Notes • Ian (Scrum Master): run a short weekly check-in against this plan, is each week's focus actually getting done, and does anything need to shift using Notion/Discord? Update Alisha about this during check in. • Alisha (Product Manager): keep this study plan mapped against the overall project timeline so studying and building don't fall out of sync. Weekly check in with each team member on how everyone is doing. • Pairing rule of thumb: put a stronger person with a weaker one on each task, rather than splitting by tech area alone. • Zaw is the most well-rounded (3/5 everywhere) – good person to float between frontend/backend/deployment wherever the team gets stuck that week. • Since Vercel is everyone's weakest spot, it's worth doing that workshop in Week 1 before anyone tries to deploy anything on their own.
